

4-Stage Superior Water Filters

Better water, Better Life

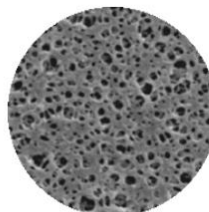

High quality Korean made Hyundai Wacortec Water filtration system comes in 4-stage filtration. Stage 1, 2 and 4 are the same for either Ultra Filtration or Nano Alkaline

1 | Sediment

2 | Pre-Carbon

3 | Ultra Filtration or Nano Alkaline

4 | Post-Carbon

Ultra Filtration

Ultra filtration has a filtration pore size of around 0.01 microns, that is between micro and nano filtration. It is capable of removing bacteria, protozoa and some viruses from the water to provide clean and healthy drinking water. This method is most popular for use in water dispensers for offices and homes.

- Effectively reduces sediment, rust, silt, lead, chlorine, by-products of disinfectant such as trihalomethane, atrazine and Lindane, microbiological cysts, bacteria and viruses
- Does not alter PH level of water
- No addition of chemicals
- Simple & safe

Nano Alkaline

Nano PH Alkaline Filtration is an effective water filtration method which employs a combination of nano filtration and ionization. Nano filtration has a filtration pore size of around 0.001 microns. It effectively removes contaminants like bacteria, protozoa and some viruses as well as most natural organic matter and some natural minerals, especially divalent ions, therefore softening water

Possible benefits of Alkaline Water:

- Better absorption of minerals
- Natural Antioxidant
- Increasing Energy level
- Hydrating cells better
- Reduces symptoms of aging
